DESCRIPTION

BENZOXAZEPINE COMPOUNDS, THEIR PRODUCTION AND USE

Technical Field

5 This invention relates to a benzoxazepine compound having an activity of lowering cholesterol-level and an activity of lowering triglyceride-level and useful for prophylaxis and therapy of hyperlipemia.

Background Art

10 Abnormal increase of concentrations of lipids in plasma is called "hyperlipidemia" or "hyperlipemia". Serum lipids include cholesterol (cholesterol ester, free cholesterol), phospholipid (lecithin, sphingomyelin, etc.), triglyceride (neutral fat), free fatty acid and other sterols. Increase of cholesterol and triglyceride is especially taken up as a problem from the clinical viewpoint [cf. Common Disease Series No.19 Koshikessho (hyperlipemia) compiled by Haruo 15 Nakamura, published by Nankodo].

20 Therefore, adequate control of lipid concentration in blood is remarkably important for the prophylaxis or therapy of various diseases related to arteriosclerosis typically exemplified by ischemic heart disease and 25 cerebral infarction. And, hypertriglyceridemia is considered to accompany pancreatic disorders.

As pharmaceutical compositions for lowering cholesterol in blood, attention has been drawn to those for controlling the biosynthesis of cholesterol, 30 besides those of inhibiting its absorption by binding bile acid including, among others, cholestyramine, colestipol (for example, USP 4027009), and those of suppressing the intestinal absorption of cholesterol by inhibiting acyl coenzyme A cholesterol acyl transferase 35 (ACAT) including melinamide (French Patent No.1476569). As pharmaceutical preparations for controlling the

5 biosynthesis of cholesterol, lovastatin (USP 4231938), simvastatin (USP 4444784), pravastatin (USP 4346227), etc., which are capable of inhibiting especially 3-hydroxy-3-methyl glutaryl coenzyme (HMG-CoA) reductase, 10 are provided for medicinal use. However, when HMG-CoA reductase is inhibited, not only the biosynthesis of cholesterol but the biosynthesis of some other components such as ubiquinone, dolichol and heme A, which are necessary for the living body, is also inhibited, so that occurrences of undesirable side effects to be caused thereby are feared.

15 While, as agents of lowering triglyceride, fibrinoic acid type compounds, for example, clofibrate (UK Patent 860303) and fenofibrate (German Patent 2250327), are provided for medicines, they are prohibited to use together with statin type compounds for the fear of causing liver-toxicity.

20 Squalene synthetase is an enzyme taking part in the essential stage of the cholesterol biosynthetic pathway. This enzyme catalyzes the reductive dimerization of two molecules of farnesyl pyrophosphate to form squalene.

25 On the other hand, the compounds expected as inhibitors of cholesterol biosynthesis by inhibiting squalene synthetase are disclosed in Journal of Medicinal Chemistry, Vol.51, No.10, pp.1869-1871, 1988, JPA H1(1989)-213288, JPA H2(1990)-101088, JPA H2(1990)-235820, JPA H2(1990)-235821, JPA H3(1991)-20226, JPA H3(1991)-68591, JPA H3(1991)-148288, and USP 5,019,390, 30 USP 5,135,935, WO9215579 and WO9309115.

35 Incidentally, hyperlipemia is also called "hyperlipoproteinemia" and is classified into the following six types (WHO classification) taking lipoproteins into consideration.

Type I : hyperchylomicronemia showing increase of chylomicrons,

Typ IIa : hyperLDLemia (hypercholesterolemia) showing increase of low-density lipoprotein (LDL),
 Type IIb : composite hyperlipemia showing increase of LDL and very-low-density lipoprotein (VLDL),
 5 Type III : abnormal β lipoproteinemia showing the presence of β very-low-density lipoprotein (β VLDL),
 Type IV : endogenous hypertriglycerolemia, and
 Type V : mixed type hyperlipemia showing increase of VLDL and chylomicrons.

In the compound represented by the formula (I) or salts thereof, asymmetric carbons exist at 3- and 5-positions, and trans-compounds, in which the substituent at 3-position and substituent at 5-position are faced to the reverse direction relative to the face of the 7-membered ring, is preferable. Especially, those in which the absolute configuration at 3-position is R-configuration and the absolute configuration at 5-position is S-configuration, are preferable.

While the compound represented by the above-mentioned formula (I) or salts thereof can be produced in accordance with, for example, methods disclosed in EPA567026, WO95/21834 [PCT application based on Japanese Patent Application H6(1994)-15531)], EPA645377 [application based on Japanese Patent Application H6(1994)-229159] and EPA645378 [application based on Japanese Patent Application H6(1994)-229160], or methods analogous to them, they can be produced also by, for example, the following methods.

More specifically, the compound of the formula (I) or a salt thereof can be produced, as shown by, for example, the following formula, by subjecting a corresponding 3-carboxymethyl compound (I') to condensation with a compound represented by the formula

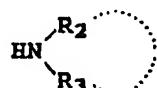

(R₂ and R₃ are defined above)

10

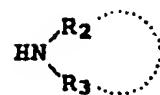

[wherein each symbol is of the same meaning as defined above].

15 The compound (I) or a salt thereof can be produced by subjecting the compound represented by the formula (I') to condensation with the compound represented by the formula

20 in a solvent, in the presence of a base when necessary, using a condensing agent. Examples of the solvent include hydrocarbons such as benzene, toluene, hexane and heptane, halogenic solvents such as dichloromethane, dichloroethane, chloroform and carbon tetrachloride, ethers such as ethyl ether, tetrahydrofuran and dioxane, acetonitrile and dimethylformamide. As the base, mention is made of triethylamine, 4-dimethylaminopyridine, triethylenediamine and tetramethylethylenediamine. As 25 the condensing agent, mention is made of condensing agents employed for the synthesis of peptide, as exemplified by dicyclohexyl carbodiimide, diethyl cyanophosphate and 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide. The compound 30 represented by the formula

35

is used in an amount ranging from 0.5 to 2 molar
 5 equivalents, preferably from 1 to 1.2 molar equivalent,
 relative to one mole of the compound shown by the
 formula (I'), and the condensing agent is used in an
 amount ranging from 0.5 to 5 molar equivalents,
 preferably from 1 to 2 molar equivalents. The reaction
 10 temperature ranges from 0 to 100 °C, preferably from 20
 to 50 °C. The reaction time ranges from 0.5 to 24
 hours, preferably from about 1 to about 5 hours.

The compound (I) or a salt thereof with X as
 15 optionally substituted heterocyclic group having a
 deprotonizable hydrogen atom, by X, or the carbamoyl
 group substituted with the optionally substituted
 heterocyclic group having a deprotonizable hydrogen
 atom can be produced by converting the carboxyl group
 in the carbamoyl group substituted with carboxyl group
 20 or a substituent having carboxyl group, shown by X,
 into carboxylic acid amido, subjecting the carboxylic
 acid amido to dehydration to convert it further into
 cyano group, then converting the cyano group into the
 optionally substituted heterocyclic group having a
 25 deprotonatable hydrogen atom.

The above-mentioned conversion of carboxylic acid
 into carboxylic acid amido can be conducted in
 accordance with a per se known method. For example, a
 compound with carboxylic acid group is subjected to
 30 condensation with ammonium or ammonium chloride, when
 necessary in the presence of a base (e.g.
 triethylamine, dimethylaminobenzene, pyridine,
 potassium carbonate, sodium carbonate, potassium
 hydrogencarbonate or sodium hydrogencarbonate), using a
 35 condensing agent such as diethyl cyanophosphate or
 dicyclohexyl carboxiimide. As the solvent to be

mployed, mention is made of ethers such as diethyl ether, tetrahydrofuran or dioxane, halogen type solvents such as dichloromethane, chloroform or carbon tetrachloride, dimethylformamide and acetonitrile. In 5 these solvents, relative to one mole of a compound having carboxyl group, 1 to 100, preferably about 1 to 5, molar equivalent of ammonia or ammonium chloride is used. The reaction temperature ranges from 0 to 100 °C, preferably from 0 to 50 °C, and the reaction time 10 ranges from 0.1 to 24 hours, preferably from about 0.5 to about 5 hours.

For converting the carboxylic acid amido obtained thus above into cyano group, a compound having carboxylic acid amide is reacted with thionyl chloride 15 in a solvent such as benzene, hexane, toluene or xylene to provide corresponding cyano compound.

The amount of thionyl chloride to be employed ranges, relative to 1 mole of the compound having carboxylic acid amido, from 1 to 10, preferably from 1 20 to 3, molar equivalents. The reaction temperature ranges from 50 to 200 °C, preferably from 70 to 150 °C. The reaction time ranges from 0.5 to 10 hours, preferably from about 0.5 to about 3 hours.

The above-mentioned conversion of cyano group into 25 the optionally substituted heterocyclic group having a deprotonizable proton, e.g. tetrazole ring, can be performed by allowing a compound having cyano group to react with trimethylsilyl azide and dibutyltin (IV) oxide in a solvent such as benzene, hexane, toluene or xylene.

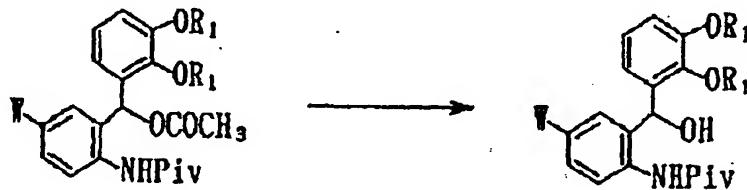

The amount of trimethylsilyl azide ranges, relative to 1 mole of the compound having cyano group, from 0.5 to 10, preferably from 1 to 3, molar 35 equivalents, and the amount of dibutyltin (IV) oxide ranges from 0.01 to 3, preferably from about 0.05 to about 1, molar equivalents. The reaction temperature

rangs from 0 to 200 °C, preferably from 50 to 150 °C. The reaction time ranges from 10 to 48 hours, preferably from 15 to 30 hours. Furthermore, conversion into, for example, 2,5-dihydro-5-oxo-1,2,4-oxadiazole ring can be performed by allowing hydroxylamine to react with the compound having cyano group, then by further carbonylating the resultant compound. Hydroxylamine (1 to 10, preferably 1 to 3, equivalents relative to 1 mole of the compound having cyano group) is allowed to react with the compound having cyano group in a solvent as exemplified by an alcohol solvent such as methanol, ethanol and propanol, dimethylformamide or acetonitrile, in the presence of a base such as sodium hydrogencarbonate, potassium hydrogencarbonate or potassium carbonate, at a temperature ranging from 30 to 150 °C, preferably from 50 to 100 °C, for 1 to 24 hours, preferably about 5 to about 10 hours. For carbonylation of the compound thus obtained, carbodiimide or phosgene, for example, is employed for the carbonylating agent, and, as the solvent, for example, ether type solvents such as diethyl ether, tetrahydrophosgene or dioxane, halogen type solvents such as dichloromethane or chloroform, and ethyl acetate are employed. The amount of the carbonylating agent ranges from 1 to 10, preferably 1 to 3 molar equivalents. The reaction temperature ranges from 30 to 150 °C, preferably from 50 to 100 °C, and the reaction time ranges from 1 to 24, preferably from about 3 to about 100 hours.

In the above-described reaction, the compound, in which the moiety corresponding to X of the synthetic intermediate is an esterified carboxyl group or an optically active carboxyl group, can be obtained by, for example, the method disclosed in WO95/21834. More specifically, at first, the corresponding racemic compound is obtained, which is then allowed to react

with an optically active amino acid to form the amido bond, followed by subjecting the resultant compound to distillation, recrystallization and column chromatography to separate and purify the optically active isomer, and then, the amido bond is again cleaved to give a (3R,5S) compound. Alternatively, by the cleaved reaction step shown by the formula:

[wherein Piv stands for pivaloyl group, and other symbols are of the same meanings as defined above], enzymatic asymmetric hydrolysis is conducted to give an optically active isomer (S-configuration) of a benzyl alcohol derivative, then, using this optically active isomer as the starting material, in accordance with the method disclosed in EPA567026, to give the above-mentioned (3R,5S) of the compound (I') as defined above.

The compound represented by the formula (I) or a salt thereof in the present invention [hereinafter sometimes called the compound of the formula (I) or the compound (I')] is low in toxicity, has a squalene synthetase inhibiting activity and an activity of lowering the level of triglyceride, and, has an excellent activity of lowering the level of lipids, and is useful for the prophylaxis or therapy of hyperlipemia such as hypercholesterolemia and hypertriglycerolemia of mammals (e.g. mouse, rat, rabbit, dog, cat, cow, pig and man), and also useful for the prophylaxis or therapy of renal diseases such as nephritis and nephropathy, arteriosclerosis, ischemic diseases, myocardial infarction, angina

pectoris, aneurysm, cerebral arteriosclerosis, peripheral arteriosclerosis, thrombosis, diabetes mellitus (e.g. insulin resistant diabetes), pancreatic disorders and re-stenosis after percutaneous 5 transluminal coronary angioplasty (PTCA).

The use of this invention is described in further detail as follows.

In view of the triglyceride-lowering activity, cholesterol-lowering activity and biological properties 10 of the compound of the formula (1), the compound is especially useful for the therapy and prophylaxis of hyperlipemia, especially hypertriglycerolemia, hyperlipoproteinemia and hypercholesterolemia, and, atherosclerotic diseases caused therefrom, and, 15 secondary diseases thereof, for example, coronary diseases, cerebral ischemia, intermittent claudication and gangrene.

For the therapy of these diseases, the compound of the general formula (1) can be used singly or in 20 combination with any other medicinal ingredients containing a lipid-level lowering agent or a cholesterol-level lowering agent. In this case, these compounds are administered, preferably, orally, and, upon necessity, they may be administered as agents for 25 rectal use in the form of suppository. Examples of medicinal agents which can be used in combination with the compound (I) include fibrates [e.g. chlorofibrate, benzafibrate and gemfibrozil], nicotinic acid, its derivatives and analogues [e.g. acipimox and probucol], 30 bile acid binding resins [e.g. cholestyramine and cholestypol], compounds inhibiting cholesterol absorption [e.g. sitosterol or neomycin], compounds controlling the biosynthesis of cholesterol [e.g. HMG-CoA reductase inhibiting agents such as lovastatin, simvastatin and pravastatin], and squalene epoxidase 35 inhibiting agents [e.g. NB-598 and analogous

compounds]. As further agents which can be used in combination with the compound (I), mention is made of, for example, oxidosqualene-lanosterolcyclases such as decalin derivatives, azadecalin derivatives and indane derivatives.

5 Additional, the compound of the general formula (I) is applicable to treatment of diseases related to hyperchylomicronemia, for example, acute pancreatitis. The mechanism of occurrence of pancreatitis has been
10 considered that minute thrombus occurs in pancreatic blood capillary by the action of chylomicron or by strong topical irritation with the increase of free fatty acid produced by decomposition of triglyceride by pancreatic lipase due to hyperchylomicronemia. In view
15 of the above, since the compound of the formula (I) of this invention has an activity of lowering the level of triglyceride, it can be used for the therapy of pancreatitis, and can be used for the therapy of pancreatitis singly or in combination with a known
20 therapeutic method. For the therapy of this disease, the compound of the formula (I) can be administered orally or topically, or it can be used singly or in combination with a known active compound. As the agent which can be combined for this purpose, mention is made
25 of, for example, aprotinin (trasylol), gabexate mesylate (FOY), nafamostat mesilate (Futhan), citicoline (nicholin) and urinastatin (miraclide). And, for the purpose of removing pain, anticholinergic drugs, non-narcotic analgesics and narcotic drugs can
30 also be used.

35 As further noticeable examples of diseases, to which the compound of the general formula (I) is applicable, mention is made of secondary hyperlipemia including, for example, diabetes mellitus, hypothyroidism, nephrotic syndrome or chronic renal failure. In many cases, these diseases cause

hyp rlipemia and the latter aggravates these diseases, causing a so-called vicious circle. Taking its lipid-level lowering activity into consideration, the compound of the general formula (I) is useful for the 5 therapy and for preventing the aggravation of these diseases. For this purpose, the compound of the general formula (I) can be administered singly or in combination with exemplary medicines set forth below.

Medicines for diabetes mellitus: kinedak, benfil, 10 humulin, euglucon, glimicron, daonil, novorin, monotard, insulins, glucobay, dimelin, rastinon, bacilcon, deamiline S, iszilins;

Medicines for hypothyroidism: thyroid (thyreoid), 15 levothyroxine sodium (thyradin S), liothyronine sodium (cydonine, cylomin);

Medicines for nephrotic syndrome: For the therapy using steroid as the first choice, use is made of, for example, prednisolone sodium succinate (predonine), 20 prednisolone sodium succinate (predonine), methyl prednisolone sodium succinate (solu-medrol) and betamethasone (renderon). And, for anticoagulant therapy, use is made of antiplatelet medicines such as dipyridamole (persantine) and dilazep hydrochloride (comelian);

Medicines for chronic renal failure: A combination of 25 diuretics [e.g. furosemide (lasix), bumetanide (lunetoron) and azosemide (diart)], hypotensive drugs (e.g. ACE inhibitors (enalapril maleate (renivace)) and Ca antagonists (Ca antagonistic drugs (maninhilone), α -receptor blocking agents is administered, preferably, 30 orally.

Another possible use of the compound of the general formula (I) of this invention is to inhibit the formation of thrombus. In view of the fact that the 35 triglyceride level in blood is an positive correlation with th blood coagulation factor VII and intake of ω -3

type fatty acid serves to lower the triglyceride level and, at the same time, the coagulation is inhibited, it has been considered that hypertriglyceremia would promote the formation of thrombus. Since VLDL (very low density lipoprotein) of the patients suffering from hyperlipemia increased more strongly the secretion of plasminogen activator inhibitor from vascular endothelial cells than that of the patients suffering from normal lipemia, it is considered that triglyceride (hereinafter TG) acts to lower the fibrinolytic activity. Therefore, taking the TG lowering action, the compound of the general formula (I) can be effectively used for the prophylaxis and therapy of the formation of thrombus. The compound (I) can be administered singly or in combination with any of the following exemplary known therapeutic agents, preferably orally.

Medicines for prophylaxis and therapy of thrombus formation: blood coagulation inhibitors [e.g. heparin sodium, heparin calcium, warfarin calcium (warfarin)], thrombolytic agents [e.g. urokinase], antiplatelet agents [e.g. aspirin, sulfinpyrazolo(anturane), dipyridamole (persantine), acropidin (panaldin), cilostazol (pleteaal)].

The compound (I) can be used orally or non-orally in the manner of injection, drip infusion, inhalation, rectal administration or topical administration, as it is or as a medicinal composition (e.g. powder, granule, tablet, pill, capsule, injection, syrup, emulsion, elixir, suspension and solution). In other words, at least one species of the compounds of this invention can be used singly or in combination with a pharmaceutically acceptable carrier (e.g. adjuvant, excipient, forming aid and/or diluent).

These pharmaceutical compositions can be prepared by a conventional method. These compositions can be

prepared by usually mixing/kneading active components with an additive such as excipients, diluents and carriers. In the present specification, "non-oral administration" include subcutaneous injection, 5 intravenous injection, intramuscular injection, intraperitoneal injection or drip infusion. Injectable compositions, for example, a sterile injectable aqueous suspension or an oily suspension, can be prepared by a known method in the relevant field using a suitable 10 dispersing agent or a moistening agent. The sterile injectable composition may be a solution or a suspension injectable under sterile conditions in a non-toxic diluent or a solvent administrable non-orally, for example, an aqueous solution. As a vehicle 15 or a solvent which can be employed, mention is made of, for example, water, a Ringer solution and an isotonic aqueous saline solution. Further, a sterile non-volatile oil can also be employed as a common solvent or a suspending solvent. For this purpose, any non-volatile oil and fatty acid can also be employed, 20 including natural or synthetic or semi-synthetic fatty oil or fatty acid as well as natural or synthetic or semi-synthetic mono- or di- or triglycerides.

The suppository for rectal use can be prepared by 25 mixing the drug with a suitable non-irritable excipient, e.g. cocoa butter or polyethylene glycol which is solid at normal temperatures, liquid at temperatures in intestinal tube, and melts and release the drug in rectum.

As the solid dosage form for oral administration, 30 mention is made of, for example, powder, granule, tablet, pill and capsule as mentioned above. The composition of such dosage form as above can be prepared by mixing and/or kneading a compound as the active component with at least one species of additives 35 as exemplified by sucrose, lactose, cellulose, mannitol.

(D-mannitol), multitol, dextrin, starch (e.g. corn starch), microcrystalline cellulose, agar, alginates, chitins, chitosans, pectins, tragacanth gum, acacia, gelatins, collagens, casein, albumin, synthetic or semi-synthetic polymers or glycerides. These compositions may optionally contain further additives, like in usual cases, for example, an inert diluent, a lubricant such as stearic acid and magnesium, a preservative such as parabens and sorbins, an antioxidant such as ascorbic acid, α -tocopherol and cysteine, a disintegrant (e.g. floscaromelose sodium), a binder (e.g. hydroxypropyl cellulose), a thickening agent, a buffering agent, a sweetening agent, a flavoring agent and perfuming agent. Tablets and pills may optionally be prepared with enteric coating. As liquid preparations for oral administration, mention is made of, for example, a pharmaceutically acceptable emulsion, syrup, elixir, suspension and solution, and they may optionally contain an inert diluent such as water and, depending on necessity, an additive. These liquid compositions for oral administration can be prepared by a conventional method, for example, mixing the compound as the active component with an inert diluent and, upon necessity, any other additive.

The orally administrable compositions, while varying with the forms, are incorporated with usually 0.01 to 99 W%, preferably 0.1 to 90 W%, commonly 0.5 to 50% of the compound of this invention as the active component. The dose for a specific patient is determined, while taking into consideration age, body weight, general health conditions, sex, diet, the time of administration, the method of administration, secretion rate, combination of drugs, conditions of the disease then the patient is receiving the therapy and any other factors. A lipid level lowering agent such as a triglycerid lev 1 low ring agent comprising the

compound (I) of this invention is relatively low in toxicity and can be safely used. Although the daily dose varies depending on the conditions and body weight of the patient, kinds of the compound, administration routes and any other factors, a daily dosage per adult human (about 60 kg body weight) in the case of, for example, oral administration for the prophylaxis and therapy of hyperlipemia ranges from about 1 to 500 mg, preferably from about 10 to 200 mg, of the effective component [compound (I)], and, in the case of a non-orally administrable composition, the daily dose range from about 0.1 to 100 mg, preferably from about 1 to 50 mg, commonly from about 1 to 20 mg in terms of the effective component. Within this range, no toxicity is observed at all.

Squalene Synthetase Inhibitory Activity

Assay Method

The squalene synthetase inhibitory activity was assayed as follows with the enzyme solutions prepared in accordance with the method described below.

More specifically, an enzyme solution (protein

cont nt 0.8 μ g) prepared in accordance with the method described below was added to a solution (total volume 50 μ l) containing 5 μ M [$1-^3$ H] farnesyl pyrophosphate (specific activity 25 μ Ci/mole), 1 mM NADPH 5 (nicotinamide adenine dinucleotide phosphate of reduced type), 5 mM MgCl₂, 6 mM glutathione, a 100 mM buffer solution of potassium phosphate (pH 7.4) and a test drug (used as an aqueous solution or a DMSO solution), then the reaction was allowed to proceed at 37°C for 45 10 minutes. To the reaction mixture was added 150 μ l of a mixture of chloroform and methanol (1:2) to suspend the reaction, followed by adding 50 μ l of chloroform and 50 μ l of a 3N solution of sodium hydroxide. 50 μ l of the chloroform layer (lower layer) containing the reaction 15 mixture having squalene as the principal component and 3 ml of toluene-based liquid scintillator were mixed, and its radioactivity was determined by means of a liquid scintillation counter.

The squalene synthetase inhibitory activity was 20 expressed in terms of the concentration inhibiting by 50% the radioactivity taken into the chloroform layer (IC₅₀, molar concentration (M)), as shown in Table 7.

Preparation of human-derived enzyme

Human hepatic carcinoma cells HepG2 (about 1 x 10⁹ 25 cells) obtained by incubation on a Dulbecco-modified Eagle's medium (37°C in the presence of 5% CO₂) containing 10% fetal bovine serum were suspended in 10 ml of an ice-cooled buffer solution [100 mM potassium phosphate buffer (pH 7.4), 30 mM nicotinamide and 2.5 mM MgCl₂]. The cells were crashed by means of 30 ultrasonication (for 30 seconds, twice). The sonicate thus obtained was subjected to centrifugation for 20 minutes (4°C) with 10000 x g. The supernatant layer was subjected to further centrifugation for 90 minutes 35 (4°C) with 105000 x g. The sediment was then suspended in an ice-cooled 100 mM potassium phosphate buffer (pH

7.4), which was again subjected to centrifugation for 90 minutes (4°C) with 105000 x g. This fraction was suspended in an ice-cooled 100 mM potassium phosphate buffer solution (pH 7.4) (about 4 mg/ml protein concentration). This suspension was used as the enzyme solution.

45 As is clear from the above results, the compounds of this invention have an excellent squalene synthetase inhibitory activity.

Experimental Example 2

Assay of cholesterologenesis in the liver:

Cholesterol biosynthesis in the liver of a rat was assayed as follows. Six-week old Wistar fatty rats were given orally a test compound [Compound 4-2 (suspended in a 0.5% methyl cellulose solution)], while the control group was orally given only a 0.5% methyl cellulose solution. One hour later, sodium acetate labelled with radioisotope ^{14}C (manufactured by Amasham) was given intravenously at the tail (10 $\mu\text{Ci}/0.3$ ml physiological saline/rat). One hour later, rats were sacrificed by decapitation, and 1.5 g of the first lobe of the liver was removed, which was saponified by immersing in 3.9 ml of an alkaline ethanol solution (KOH:EtOH=1:2) at 100°C for two hours, followed by extraction with 5 ml each portion of petroleum ether three times. The extract solution was dried, which was dissolved in 3 ml of ethanol:acetone (1:1). To the solution was added 2 ml of a 0.5% digitonin-ethanol solution. The mixture was left standing for one hour. Resulting precipitates were collected as total sterol, and the radioactivity was measured by means of a liquid scintillation counter. The results are shown below.

25	Amount given	Cholesterogenesis inhibitory rate (%)
	0.6 mg/kg	80.1%
	2.0 mg/kg	90.4%

30 As shown in the above results, the compound of this invention performs an excellent effect of inhibiting the cholesterologenesis by 80% or more.
